

IDENTITY · TENANT MIGRATION · ENTRA ID · OKTA · PINGONE

Move SSO applications between identity tenants in hours, not months.

TenantFlex discovers every SAML and OIDC application in a tenant, flags what needs a human decision, and recreates the rest in another tenant, with an audit trail for every step. The source tenant is read-only throughout.

DEALS

Mergers, acquisitions, divestitures

Every deal ends with hundreds of applications that have to work in another tenant on Day 1. Discover at signing, pilot, migrate in waves, cut over on the date.

DISASTER RECOVERY

Backup and a rehearsed cutover

A restorable backup of every integration, a standby tenant at another provider with the applications already in it, and a cutover you have run before. Evidence for DORA.

RENEWALS

Cost the switch before you sign

Discovery gives the real application count and the cost of leaving. Put it next to the quote and negotiate with a credible walk-away, even if you stay.

STEP 1

Discover

Connect a tenant read-only. Every SAML and OIDC application, its claims, assignments, certificates and expiry, banded by how hard it is to move.

STEP 2

Review

Decide the few things that need a human: complex claims, unmatched assignments, applications nobody owns. Approve the job; the approver cannot be its creator.

STEP 3

Migrate and verify

Applications are recreated in the destination, read back and compared with the source. Each owner gets a hand-off bundle. Failures roll back.

What you get

- **Inventory and bands.** Every application with its claims, assignments, certificates and expiry, and how hard it is to move.
- **Claims mapped through one vocabulary.** Standard claims migrate automatically; complex ones are flagged before anything moves.
- **Verification.** Every setting read back from the destination and compared with the source.
- **Hand-off bundle per owner** and an execution log per job, exportable and streamed to your SIEM.

BUILT FOR THE SECURITY REVIEW

- Source connections are read-only by permission. Write access exists only on a destination.
- MFA and passkeys; step-up for approvals and secret access; a different person must approve a job than the one who created it.
- Credentials encrypted at rest with rotatable keys. Backups and bundles never contain secret values.
- Three-year audit trail. EU-hosted SaaS, or the same release on-premises.

Licensed per application in scope, not per seat.

Discovery gives you the count before you commit. Self-service, or white-glove with the people who have done these migrations by hand. Standby is priced per application under protection, per year. Ask for a quote at info@tenantflex.com.
